

STELLAR STAR ®

Post emergent selective herbicide for control of grasses and broadleaf weeds in maize and sugarcane.

Be a winner - Take Control

KEY ADVANTAGES:

- Wide weed spectrum, post-emergent solution
- Safe and easy to apply
- Long window of application
- Resistance management tool
- Low dose rate
- Control of over 50 different weeds

DIRECTIONS:

- **Stellar Star** should be applied during favourable growing conditions for optimum crop tolerance and weed control.
- Apply **Stellar Star** as a post emergence treatment to maize and sugarcane when weeds are actively growing.
- Best applied when weeds have reached the 2 – 6 leaf stage (when weeds are 5 cm or less tall).
- Weeds must be thoroughly covered with spray. Dense leaf canopies shelter small weeds and can prevent adequate spray coverage.
- Do not apply after the maize has reached a height of 800 mm. After the maize has reached 80cm height apply in between the rows and avoid the product does not go into the funnel of the maize
